

1. AWM: Association for Women in Mathematics

- a. This math association's only usable resources are the databases it directs you to. statusofwomendata.org is a nice dashboard, but the information is super general, not necessarily relating to math. It provides relevant technical reports on women in mathematics. We can use NPL to analyze these reports. However, there are a lot of other resources (reports, books, etc.) that are over 10 years old, mostly computer science related or directed at faculty and colleges instead of relevant math department/community information.

2. urban.org

- a. This provides briefs and short reports that are not math focused. Any math specific search yields irrelevant or outdated reports. This might be a good way to start to quantify the information that is missing or was missing.

3. NCES: National Center for Education Statistics

- a. This is the home of the Integrated Postsecondary Education Data System (IPEDS). IPEDS has a lot of information that (I think) can be converted to datasets. It has general data tables about post secondary enrollment/graduation/etc., as well as general trend lines that we can look into. They are super general but might supply some assumptions we can use if we end up doing any decently in-depth analysis. There is also the option to look up institutions individually, and there is a lot of information on Title IV institutions. These individual look-ups also have a "Completions" section which can be divided by departments (# of degrees awarded).

4. CBMS: Conference Board of the Mathematical Sciences

- a. This conference provides the book “Mathematical Education of Teachers” on their website by chapter. We can analyze this using NLP as well if we find it useful; we can use this for possible information on math teachers not in post secondary education. The CBMS also releases reports that include post secondary enrollment, degrees granted, instructor appointment types, teaching methods, number of faculty etc. (There is a lot of information available in these reports!) The earliest report is from 1970, and the latest report is from 2021. They also have a Covid impact report.
5. Math Department Reports
- a. University systems (and individual universities) across the country release standard enrollment and departmental reports. All (or most) university systems are just of public universities, so if we really want to use this data, we’d also have to sample from some private systems and universities as well (if that data is available). From a quick search of university system reports, I found three university systems in the south that release standard reports. I also found one in the west.
 - b. South
 - i. University System of Georgia (26 colleges and universities)
 - ii. University of North Carolina System (17 colleges and universities)
 1. Has an interactive database for degrees awarded split by department.
 2. Information available to download in a csv or pdf.
 - iii. Mississippi Institutions of Higher Learning

1. Same database as UNC system, along with visual tables.
2. Information available to download in a pdf.

c. West

i. California State University System

1. Has interactive databases for enrollment trends by department.
2. Information available to download in a csv or pdf.
